FIELD OF THE INVENTION

[0001] The present invention relates to a PD-1 antibody, a PD-1 antigen-binding fragment, a chimeric antibody and humanized antibodies comprising the CDR of the PD-1 antibody, as well as a pharmaceutical composition comprising the PD-1 antibody and the antigen-binding fragment thereof, as well as its use as an anti-cancer drug.

BACKGROUND OF THE INVENTION

[0002] Tumor immunotherapy is a hot spot in tumor therapeutic area for a long time. T cell associated cancer immunotherapy is at the core position. Tumor immunotherapy affects tumors by utilizing and mobilizing cytotoxic T lymphocytes in patients with tumors; it may be the most effective and safest way for cancer treatment. At the same time, tumor escape is a huge obstacle faced by tumor immunotherapy, in which cancer cells promote rapid growth of the tumor via its inhibitory effect on the immune system.

[0003] There is extremely complex relationship between tumor immune escape mechanism and body’s immune response to tumors. In early stage of tumor immunotherapy, tumor-specific killer T cells have biological activity, but lose the killing function in the late stage of tumor growth. So tumor immunotherapy is to utmostly enhance the response of the patient’s own immune system to the tumor. The key of tumor immunotherapy is not only to activate the response of the existing immune system, but also to maintain the duration and intensity of the response of the immune system.

[0004] Human T-cell activation in vivo is implemented by a two-signaling-pathway system which not only needs to submit a MHC-antigen peptide via antigen-presenting cells to T cells to provide a first signal, but also requires a series of costimulatory molecules to provide a second signal, and then T cells exhibit normal immune response. This double-signaling system plays a vital role in balance of the immune system, and strictly regulates the different immune response associated by numerous antigens. The absence of a second signal provided by costimulatory molecules will result in no response or sustained-specific T cell immune response, consequently leading to tolerance. Therefore, the second signal pathway plays a key regulatory role in the whole process of the immune response.

[0005] Programmed death-1 (PD-1), found in 1992, is a protein receptor expressed in T cell surface, and is involved in cell apoptosis. PD-1 belongs to CD28 family, exhibits 25% homology in amino acid sequence with cytokotoxic T lymphocyte antigen 4 (CTLA-4), but is mainly expressed in activated T cells, B cells and myeloid cells, which is different from CTLA. PD-1 has two ligands, PD-L1 and PD-L2 respectively. PD-L1 is mainly expressed in T cells, B cells, macrophages, and dendritic cells (DC), and the expression is upregulated in the activated cells. The expression of PD-L2 is mainly limited to antigen-presenting cells, such as activated macrophages and dendritic cells.

[0006] New studies have detected high expression of PD-1 protein in human tumor tissues such as breast cancer, lung cancer, stomach cancer, intestinal cancer, renal cancer, melanoma and others, and the expression levels of PD-1 is closely related to clinical condition and prognosis of patients. For PD-1 inhibits T cell proliferation through the second signaling pathway, blocking the binding of PD-L1/PD-1 becomes a very promising target in tumor immunotherapy field.

[0007] Currently, there are several multinational pharmaceutical companies engaged in monoclonal antibodies against PD-1, which maximize the self immune response of patients against tumor by blocking the binding of PD-L1/PD-1, and sequentially achieve the killing purpose against tumor cells, such as WO200914335. In the clinical results of BMS' and Merck’s PD-1 monoclonal antibodies, certain response rate have been observed in non-small cell lung cancer, melanoma and renal carcinoma, and the response rate exhibited prominently high relevance with PD-L1 expression in tumors, which suggested that PD-1 antibody exerts a positive effect on tumors.

[0008] The present invention provides a PD-1 antibody with high affinity, high selectivity, and high biological activity.

SUMMARY OF THE INVENTION

[0009] The present invention provides a PD-1 antibody or an antigen-binding fragment thereof, comprising:

[0010] a light chain variable region comprising at least one LCDR selected from those sequences as shown in: SEQ ID NO: 6, SEQ ID NO: 7 or SEQ ID NO: 8; and

[0011] a heavy chain variable region comprising at least one HCDR selected from those sequences as shown in: SEQ ID NO: 3, SEQ ID NO: 4 or SEQ ID NO: 5.

[0012] In a preferred embodiment of the present invention, provided is a PD-1 antibody or an antigen-binding fragment thereof, wherein the light chain variable region comprises a LCDR1 as shown in SEQ ID NO: 6.

[0013] In a preferred embodiment of the present invention, provided is a PD-1 antibody or an antigen-binding fragment thereof, wherein the light chain variable region comprises a LCDR2 as shown in SEQ ID NO: 7.

[0014] In a preferred embodiment of the present invention, provided is a PD-1 antibody or an antigen-binding fragment thereof, wherein the light chain variable region comprises a LCDR3 as shown in SEQ ID NO: 8.

[0015] In a preferred embodiment of the present invention, provided is a PD-1 antibody or an antigen-binding fragment thereof, wherein the heavy chain variable region comprises a HCDR1 as shown in SEQ ID NO: 3.

[0016] In a preferred embodiment of the present invention, provided is a PD-1 antibody or an antigen-binding fragment thereof, wherein the heavy chain variable region comprises a HCDR2 as shown in SEQ ID NO: 4.

[0017] In a preferred embodiment of the present invention, provided is a PD-1 antibody or an antigen-binding fragment thereof, wherein the heavy chain variable region comprises a HCDR3 as shown in SEQ ID NO: 5.

[0018] In a preferred embodiment of the present invention, provided is a PD-1 antibody or an antigen-binding fragment thereof, wherein the light chain variable region comprises a LCDR1, a LCDR2 and a LCDR3 as shown in SEQ ID NO: 6, SEQ ID NO: 7 and SEQ ID NO: 8, respectively.

[0019] In a preferred embodiment of the present invention, provided is a PD-1 antibody or an antigen-binding fragment thereof, wherein the heavy chain variable region comprises a HCDR1, a HCDR2 and a HCDR3 as shown in SEQ ID NO: 3, SEQ ID NO: 4 and SEQ ID NO: 5, respectively.
In a preferred embodiment of the present invention, a PD-1 antibody or an antigen-binding fragment thereof, wherein the light chain variable region comprises a LCDR1, a LCDR2 and a LCDR3 as shown in SEQ ID NO: 6, SEQ ID NO: 7 and SEQ ID NO: 8, respectively; and wherein the heavy chain variable region comprises a HCDR1, a HCDR2 and a HCDR3 as shown in SEQ ID NO: 3, SEQ ID NO: 4 and SEQ ID NO: 5, respectively.

In a preferred embodiment of the present invention, according to the PD-1 antibody or the antigen-binding fragment thereof provided herein, the antibody is a murine antibody or a fragment thereof.

In a preferred embodiment of the present invention, according to the murine antibody or the fragment thereof provided herein, the light chain variable region further comprises the light chain FR of murine κ, λ chain or a variant thereof.

In a preferred embodiment of the present invention, the murine antibody or the fragment thereof provided herein further comprises a light chain constant region of murine κ, λ chain or a variant thereof.

In a preferred embodiment of the present invention, according to the murine antibody or the fragment thereof provided herein, the heavy chain variable region further comprises the heavy chain FR of murine IgG1, IgG2, IgG3, IgG4 or a variant thereof.

In a preferred embodiment of the present invention, the murine antibody or the fragment thereof provided herein further comprises a heavy chain constant region of murine IgG1, IgG2, IgG3, IgG4 or a variant thereof.

In a preferred embodiment of the present invention, according to the PD-1 antibody or antigen-binding fragment provided herein, the antibody is a chimeric antibody or a fragment thereof.

In a preferred embodiment of the present invention, according to the PD-1 antibody or fragment thereof provided herein, the light chain variable region sequence of the chimeric antibody is SEQ ID NO: 10.

In a preferred embodiment of the present invention, according to the PD-1 antibody or the fragment thereof provided herein, the heavy chain variable region sequence of chimeric antibody is SEQ ID NO: 9.

In a preferred embodiment of the present invention, the PD-1 chimeric antibody or the fragment thereof provided herein further comprises a light chain constant region of human κ, λ chain or a variant thereof.

In a preferred embodiment of the present invention, the PD-1 chimeric antibody or the fragment thereof provided herein further comprises a heavy chain constant region of human IgG1, IgG2, IgG3 or IgG4 or a variant thereof, preferably comprises a heavy chain constant region of human IgG2 or IgG4, or that of IgG1 which has no ADCC (antibody-dependent cell-mediated cytotoxicity) after amino acid mutation.

In a preferred embodiment of the present invention, according to the PD-1 antibody or the antigen-binding fragment provided herein, the antibody is a humanized antibody or a fragment thereof.

In a preferred embodiment of the present invention, according to the PD-1 humanized antibody or the fragment thereof provided herein, the light chain variable region of the humanized antibody further comprises light chain FR of human κ, λ chain or a variant thereof.

In a preferred embodiment of the present invention, according to the PD-1 humanized antibody or the fragment thereof provided herein, the light chain FR sequence of the light chain variable region of the humanized antibody is derived from a combination sequence of human germline light chains IGVK1-39 and JK4 as shown in SEQ ID NO: 14, comprising FR1, FR2 and FR3 of IGVK 1-39 and FR4 of JK4.

In a preferred embodiment of the present invention, according to the PD-1 humanized antibody or the fragment thereof provided herein, the sequence of the humanized antibody light chain is shown in SEQ ID NO: 12 or a variant thereof.

In a preferred embodiment of the present invention, according to the PD-1 humanized antibody or the fragment thereof provided herein, the variant of humanized antibody light chain variable region comprises a 0-10 amino acid mutation in the light chain variable region, preferably A43 S.

In a preferred embodiment of the present invention, the PD-1 humanized antibody or the fragment thereof provided herein further comprises a light chain constant region of human κ, λ chain or a variant thereof.

In a preferred embodiment of the present invention, according to the PD-1 humanized antibody or the fragment thereof provided herein, the heavy chain variable region further comprises a heavy chain FR of human IgG1, IgG2, IgG3, IgG4, or a variant thereof.

In a preferred embodiment of the present invention, according to the PD-1 humanized antibody or fragment thereof provided herein, the heavy chain FR sequence of the heavy chain variable region of the humanized antibody is derived from a combination sequence of human germline heavy chains IgH V3-7 and JH6 as shown in SEQ ID NO: 13, comprising FR1, FR2 and FR3 of IgH V3-7 and FR4 of JH6.

In a preferred embodiment of the present invention, according to the PD-1 humanized antibody or the fragment thereof provided herein, the sequence of the humanized antibody heavy chain is shown in SEQ ID NO: 11 or a variant thereof; wherein the variant preferably comprises a 0-10 amino acid mutation in the heavy chain variable region, more preferably G44R.

In a preferred embodiment of the present invention, the PD-1 humanized antibody or the fragment thereof provided herein further comprises a heavy chain constant region of human IgG1, IgG2, IgG3 or IgG4 or a variant thereof, and preferably comprises a heavy chain constant region of human IgG2 or IgG4 which has no ADCC, or that of IgG1 which has no ADCC (antibody-dependent cell-mediated cytotoxicity) after amino acid mutation. The variant is preferably a heavy chain constant region mutation which causes ADCC attenuation or deficiency, and more preferably N297A, L234A, L235A of IgG1, IgG2/4 chimeras, and F235E or L234A/F235A of IgG4.

In a preferred embodiment of the present invention, according to the PD-1 antibody or the antigen-binding fragment provided herein, the antigen-binding fragment is Fab, Fv, scFv or F(ab')2.

The present invention further provides a DNA molecule encoding the PD-1 antibody or the antigen-binding fragment described above.

The present invention further provides an expression vector comprising the DNA molecule as described above.
The present invention further provides a host cell transformed with the expression vector as described above. In a preferred embodiment of the present invention, according to the host cell provided herein, the host cell is bacteria, preferably E. coli. In a preferred embodiment of the present invention, the host cell provided herein is yeast, preferably *Pichia pastoris*.

The present invention further provides a pharmaceutical composition which comprises the PD-1 antibody or the antigen-binding fragment thereof as described herein and a pharmaceutically acceptable excipient, diluent or carrier.

The present invention further provides use of the above PD-1 antibody or the antigen-binding fragment, or the pharmaceutical composition containing the same, in the preparation of a medicament for treatment of a PD-1 mediated disease or disorder; wherein the disease is preferably cancer, more preferably PD-L1-expressing cancer; and the cancer is preferably breast cancer, lung cancer, stomach cancer, intestinal cancer, renal cancer, melanoma, and most preferably non-small cell lung cancer, melanoma and renal cancer.

The present invention further provides a method for treating and preventing the PD-1 mediated disease or disorder, comprising administering to a subject in need thereof a therapeutically effective amount of the PD-1 antibody or the antigen-binding fragment thereof according to the invention, or the pharmaceutical composition comprising the same; wherein the disease is preferably cancer, more preferably PD-L1-expressing cancer; the cancer is preferably breast cancer, lung cancer, stomach cancer, intestinal cancer, renal cancer, melanoma, non-small cell lung cancer, and most preferably non-small cell lung cancer, melanoma and renal cancer.

**BRIEF DESCRIPTION OF THE DRAWINGS**

**FIG. 1:** Human peripheral blood mononuclear cell proliferation assay. Result shows that the test PD-1 antibody mAb005 can effectively stimulate the proliferation of human peripheral blood mononuclear cells, with EC50 of 83 ng/ml.

**FIG. 2:** Human peripheral blood mononuclear cell cytokine IFN-γ secretion test. Result shows that the test PD-1 antibody mAb005 can stimulate PBMC proliferation, and effectively stimulate secretion of cytokine IFN-γ at the same time, with EC50 of 13 ng/ml.

**FIG. 3:** Inhibitory effect of PD-1 antibody H005-1 on growth of glioma cells.

**FIG. 4:** diagram showing tumor volume change after treatment.

**FIG. 5:** diagram showing weight change of mice after treatment.

**DETAILED DESCRIPTION OF THE INVENTION**

1. Definitions

In order to more readily understand the invention, certain technical and scientific terms are specifically defined below. Unless specifically defined elsewhere in this document, all other technical and scientific terms used herein have the meaning commonly understood by one of ordinary skill in the art to which this invention belongs.

As used herein, the single-letter code and the three-letter code for amino acids are as described in J. biol. chem. 243, (1968) p3558.

As used herein, “Antibody” refers to immunoglobulin, a four-peptide chain structure connected together by disulfide bonds between two identical heavy chains and two identical light chains. Different immunoglobulin heavy chain constant regions exhibit different amino acid compositions and rank orders, thereby presenting different kinds of antigenicity. Accordingly, immunoglobulins can be divided into five categories, or called immunoglobulin isotypes, namely IgM, IgD, IgG IgA and IgE, their heavy chains are μ chain, δ chain, γ chain, γ chain and ε chain, respectively. According to its amino acid composition of hinge region and the number and location of heavy chain disulfide bonds, the same type of Ig can be divided into different sub-categories, for example, IgG can be divided into IgG1, IgG2, IgG3, and IgG4. Light chain can be divided into κ or λ chain considering of different constant regions. Each of the five lgs can have κ or λ chain.

In the present invention, the antibody light chain variable region mentioned herein further comprises a light chain constant region, which comprises a human or murine κ, λ chain or a variant thereof.

In the present invention, the antibody heavy chain variable region mentioned herein further comprises a heavy chain constant region, which comprises human or murine lgG1, 2, 3, 4 or a variant thereof.

Near the N-terminal sequence of the antibody heavy chains and light chains, about 110 amino acid sequence varies largely, known as the variable region (V region); the rest of the amino acid sequence near the C-terminus is relative stable, known as the constant region (C region). Variable region comprises three hypervariable regions (HVR) and four relatively conserved sequence framework region (FR). The three hypervariable regions determine the specificity of the antibody, also known as a complementarity determining region (CDR). Each light chain variable region (LCVR) and each heavy chain variable region (HCVR) is composed of three CDRs and four FRs, with sequentially order from the amino terminal to the carboxyl terminal being FR1, CDR1, FR2, CDR2, FR3, CDR3, and FR4. Three light chain CDRs refer to LCDR1, LCDR2, and LCDR3; three heavy chain CDRs refer to HCVR1, HCVR2 and HCVR3. The numbers and locations of CDR amino acid residues in LCVR and HCVR of the antibody or the antigen-binding fragment herein correspond with known Kabat numbering criteria (I, CDR1-3, HCD2-3), or correspond with kabat and chothia numbering criteria (HCVR1).

The term “murine antibody” in the present invention refers to anti-human-PD-1 monoclonal antibody prepared according to the knowledge and skills in the art. During the preparation, a test object was injected with PD-1 antigen, and then hybridoma expressing antibody which possesses desired sequence or functional characteristics was separated. In a preferred embodiment of the present invention, the murine PD-1 antibody or the antigen-binding fragment thereof further comprises a light chain constant region of murine κ, λ chain or a variant thereof, or further comprises a heavy chain constant region of murine lgG1, lgG2, lgG3 or lgG4, or a variant thereof.

The term “chimeric antibody”, is an antibody which is formed by fusing the variable region of a murine
antibody with the constant region of a human antibody, the chimeric antibody can alleviate the murine antibody-induced immune response. To establish a chimeric antibody, hybridoma secreting specific murine monoclonal antibody is first established, a variable region gene is cloned from mouse hybridoma cells, then a constant region gene of a human antibody is cloned as desired, the mouse variable region gene is ligated with the human constant region gene to form a chimeric gene which can be inserted into a human vector, and finally the chimeric antibody molecule is expressed in the eukaryotic or prokaryotic industrial system. In a preferred embodiment of the present invention, the light chain variable region of PD-1 chimeric antibody further comprises the light chain FR of murine κ, λ chain or a variant thereof, and the sequence of the light chain variable region is shown in SEQ ID NO: 10. The heavy chain variable region of the PD-1 chimeric antibody further comprises the heavy chain FR of murine IgG1, IgG2, IgG3, or IgG4 or a variant thereof, and the sequence of the heavy chain variable region is shown in SEQ ID NO: 10. The constant region of a human antibody is selected from the heavy chain constant region of human IgG1, IgG2, IgG3 or IgG4 or a variant thereof, preferably comprises the heavy chain constant region of human IgG2 or IgG4, or that of IgG1 which has no ADCC (antibody-dependent cell-mediated cytotoxicity) after amino acid mutation.

The term "humanized antibody", also known as CDR-grafted antibody, refers to an antibody generated by grafting murine CDR sequences into a variable region framework of a human antibody, namely, a sequence of human germline antibody framework of different type. Humanized antibody overcomes the disadvantageously strong antibody response induced by the chimeric antibody which carries a large amount of murine protein components. Such framework sequences can be obtained from public DNA database covering germline antibody gene sequences or published references. For example, germline DNA sequences of human heavy and light chain variable region genes can be found in "Vbase" human germline sequence database (available on web www.mrcpep.com.ac.uk/vbase/), as well as can be found in Kaban, E.A., et al. 1991 Sequences of Proteins of Immunological Interest, 5th Ed. In a preferred embodiment of the invention, the murine CDR sequences of PD-1 humanized antibody are selected from SEQ ID NO: 3, 4, 5, 6, 7, 8. Human antibody variable region frameworks were designed and selected such that the light chain FR sequence of the antibody light chain variable region is derived from combination sequence of human germline light chains IGKV1-39 and JK4; SEQ ID NO: 14, comprising FR1, FR2 and FR3 of IGKV1-39 and FR4 of JK4; the heavy chain FR sequence of the antibody heavy chain variable region is derived from combination sequence of human germline heavy chains IghV3-7 and JH6; SEQ ID NO: 13, comprising FR1, FR2 and FR3 of IghV3-7 and FR4 of JH6. To avoid activity decrease during immunogenicity reduction, the variable region of the human antibody is subjected to a minimum back mutation to maintain the activity.

As used herein, "antigen-binding fragment" refers to a Fab fragment, a Fab' fragment, a F(ab')2 fragment with antigen-binding activity, as well as a fragment sFv fragment binding with human PD-1; comprising one or more CDR regions of antibodies described in the present invention selected from the group consist of SEQ ID NO:3 to SEQ ID NO:8. Fv fragment is a minimum antibody fragment comprising a heavy chain variable region, a light chain variable region, and all antigen-binding sites without a constant region. Generally, Fv antibody further comprises a polypeptide linker between the VH and VL domains, and is capable of forming a structure required for antigen binding. Also, different linkers can be used to connect the variable regions of two antibodies to form a polypeptide, named single chain antibody or single chain Fv (sFv). As used herein, the term "binding with PD-1", means interacting with human PD-1. As used herein, the term "antigenic determinant" of the present invention, refers to discontinuous three-dimensional sites on the antigen, recognized the antibody or the antigen-binding fragment of the present invention.

[0066] As used herein, the term "ADCC", namely antibody-dependent cell-mediated cytotoxicity, refers to cells expressing Fc receptors directly kill target cells coated by an antibody through recognizing the Fe segment of the antibody. ADCC effector function of the antibody can be reduced or eliminated via modification of the Fe segment in IgG. The modification refers to mutations of the antibody heavy chain constant region, such as mutations selected from N297A, L234A, L235A in IgG1; IgG2/4 chimeras; F235E, or L234A/E235A mutations in IgG4.

[0067] As used herein, fusion protein described in the present invention is a protein product obtained by co-expressing two genes via recombinant DNA technology. Recombinant PD-1 extracellular domain fusion protein obtained by co-expressing a PD-1 extracellular domain and a human antibody Fc fragment via recombinant DNA technology. The PD-1 extracellular domain refers to the moiety of PD-1 outside cytomembrane, the sequence of which is the scribing region of SEQ ID NO: 1 below.

[0068] Methods for producing and purifying antibodies and antigen-binding fragments are well known in the art and can be found, for example, in Antibody Experimental Technology Guide of Cold Spring Harbor, Chapter 5-8 and 15. For example, mice can be immunized with human PD-1, or fragments thereof, and the resulting antibodies can then be retutnated, purified and sequenced using conventional methods well known in the art. Antigen-binding fragments can also be prepared by conventional methods. The antibody or the antigen-binding fragment of the present invention is genetically engineered to introduce one or more human framework regions (FRs) to a non-human derived CDR. Human FR germline sequences can be obtained from ImmunoGeneTics (MGIT) via their website http://imgt.cines.fr, or from The Immunoglobulin FactsBook, 2001 ISBN012441351. Specifically, light chain FR germline for use in the antibody or the antigen-binding fragment of the present invention include A3 and O2. Particular heavy chain FR germline for use in the antibody or the antigen-binding fragment of the present invention include VH3-21 and VH3-23.

[0069] The engineered antibody or antigen-binding fragment of the present invention may be prepared and purified using conventional methods. For example, cDNA sequences encoding a heavy chain (SEQ ID NO: 11) and a light chain (SEQ ID NO: 12) may be cloned and recombined into a GS expression vector. The recombinant immunoglobulin expression vector may then stably transfect CHO cells. As a more recommended method well known in the art, mammalian expression of antibodies will result in glycosylation, typically at the highly conserved N-terminal in the FC region.
Stable clones may be obtained through expression of an antibody specifically binding to human PCSK9. Positive clones may be expanded in a serum-free culture medium for antibody production in bioreactors. Culture medium, into which an antibody has been secreted, may be purified by conventional techniques. For example, the medium may be conveniently applied to a Protein A or G Sepharose FF column that has been equilibrated with a compatible buffer. The column is washed to remove nonspecific binding components. The bound antibody is eluted by pH gradient and antibody fragments are detected by SDS-PAGE, and then pooled. The antibody may be filtered and concentrated using common techniques. Soluble aggregate and multimers may be effectively removed by common techniques, including size exclusion or ion exchange. The obtained product may be immediately frozen, for example at -70°C, or may be lyophilized.

[0070] The antibody of the present invention is a monoclonal antibody. Monoclonal antibody or mAb, as used herein, refers to an antibody that is derived from a single clone including but not limited to any eukaryotic, prokaryotic, or phage clone. Monoclonal antibodies and antigen-binding fragments thereof can be selected, for example, by hybridoma technologies, recombinant technologies, phage display technologies, synthetic technologies (e.g., CDR-grafting), or other technologies known in the art.

[0071] “Administration” and “treatment,” as it applies to an animal, human, experimental subject, cell, tissue, organ, or biological fluid, refers to contacting an exogenous pharmacological, therapeutic, diagnostic agent, or composition with the animal, human, subject, cell, tissue, organ, or biological fluid. “Administration” and “treatment” can refer, e.g., to therapeutic, pharmacokinetic, diagnostic, research, and experimental methods. Treatment of a cell encompasses contacting a reagent with the cell, as well as contacting a reagent with a fluid, where the fluid is in contact with the cell. “Administration” and “treatment” also means in vitro and ex vivo treatments, e.g., of a cell, by a reagent, diagnostic, binding compound, or by another cell. “Treatment,” as it applies to a human, veterinary, or a research subject, refers to therapeutic treatment, prophylactic or preventative measures, to research and diagnostic applications.

[0072] “Treat” means to administer a therapeutic agent, such as a composition comprising any of the binding compounds of the present invention, internally or externally to a patient having one or more disease symptoms for which the agent has known therapeutic activity. Typically, the agent is administered in an amount effective to alleviate one or more disease symptoms in the treated patient or population, whether by inducing the regression of or inhibiting the progression of such symptom(s) to any clinically measurable degree. The amount of a therapeutic agent that is effective to alleviate any particular disease symptom (also referred to as “therapeutically effective amount”) may vary according to factors such as the disease state, age, and weight of the patient, and the ability of the drug to elicit a therapeutic response in the patient. Whether a disease symptom has been alleviated can be assessed by any clinical measurement typically used by physicians or other skilled healthcare providers to assess the severity or progression status of that symptom. While an embodiment of the present invention (e.g., a treatment method or article of manufacture) may not be effective in alleviating the disease symptom(s) of interest in every patient, it should alleviate the target disease symptom(s) of interest in a statistically significant number of patients as determined by any statistical test known in the art such as the Student’s t-test, the chi-square test, the U-test according to Mann and Whitney, the Kruskal-Wallis test (H-test), Jonckheere-Terpstra-test and the Wilcoxon-test.

[0073] “Conservative modifications” or “conservative replacement or substitution” refers to substitutions of amino acids in a protein with other amino acids having similar characteristics (e.g., charge, side-chain size, hydrophobicity/hydrophilicity, backbone conformation and rigidity, etc.), such that the changes can frequently be made without altering the biological activity of the protein. Those of skill in the art recognize that, in general, single amino acid substitutions in non-essential regions of a polypeptide do not substantially alter biological activity (see, e.g., Watson et al. (1987) Molecular Biology of the Gene. The Benjamin/ Cummings Pub. Co., p. 224 (4th Ed.)). In addition, substitutions of structurally or functionally similar amino acids are less likely to disrupt biological activity.

[0074] “Consisting essentially of,” or its variation as used throughout the specification and claims, indicate the inclusion of any recited elements or group of elements, and the optional inclusion of other elements of similar or different nature than the recited elements, which do not materially change the basic or novel properties of the specified dosage regimen, method, or composition. As a nonlimiting example, a binding compound which consists essentially of a recited amino acid sequence may also include one or more amino acids that do not materially affect the properties of the binding compound.

[0075] “Effective amount” encompasses an amount sufficient to ameliorate or prevent a symptom or sign of a medical condition. Effective amount also means an amount sufficient to allow or facilitate diagnosis. An effective amount for a particular patient or veterinary subject may vary depending on factors such as the condition being treated, the general health of the patient, the route and dose of administration and the severity of side effects. An effective amount can be the maximal dose or dosing protocol that avoids significant side effects or toxic effects.

[0076] “Exogenous” refers to substances that are produced outside an organism, cell, or human body, depending on the context. “Endogenous” refers to substances that are produced within a cell, organism, or human body, depending on the context.

[0077] “Homology” refers to sequence similarity between two polynucleotide sequences or between two polypeptides. When a position in both of the two compared sequences is occupied by the same base or amino acid monomer subunit, e.g., if each position in each of two DNA molecules is occupied by adenine, then the molecules are homologous at that position. The percent of homology between two sequences is a function of the number of matching or homologous positions shared by the two sequences divided by the number of positions compared. For example, if 6 of 10 positions in two sequences are matched or homologous when the sequences are optimally aligned, then the two sequences are 60% homologous. Generally, the comparison is made when two sequences are aligned to give maximum percent homology.

[0078] As used herein, the expressions “cell,” “cell line,” and “cell culture” are used interchangeably and all such designations include progeny. Thus, the words “transformants” and “transformed cells” include the primary subject
EXAMPLE 1

Antibody Preparation

[0083] Murine monoclonal antibodies against human PD-1 were generated. Purified recombinant PD-1 extracellular domain Fc fusion protein (PD-1 Fc) (SEQ ID NO: 1); or CHO cells transfected with PD-1 (SEQ ID NO: 2) was used as an antigen to immunize Balb/C mice and SJL mice. Human PD-1 antigen was purchased from ORIGENE, Cat No. SC117011, NCBI Reference Sequence: NM_005018.1.

[0084] Immunization with the PD-1 extracellular domain-Fe fusion protein is devised into high dose (50 µg) and low dose (10 µg) of the purified antigen, immunization with the PD-1 transfected CHO cells uses 0.5-1×10^7 cells. Immunization was carried out on day 0, 14, and 35 respectively with Complete Freund's adjuvant; blood was sampled in the retro-orbital site to monitor the immune response. Mice with anti-PD-1 human immunoglobulin titer were obtained by plasma screening ELISA. On day 56, mice with the highest anti-PD-1 human immunoglobulin titer were subjected to boost immunization. 3 days later, mice were sacrificed and the spleen was removed for fusion. Hybridoma fusions were screened and a murine monoclonal antibody mAb005 was obtained. The heavy chain variable region sequence and light chain variable region sequence of the murine monoclonal antibody mAb005 are as follows:

mAb005 HCVR

EXAMPLE 2

Antibody Screening

[0086] In vitro PD-1 antibody ELISA binding assay:

[0087] The PD-1 antibody blocks signaling pathway of PD-1 and its ligand by binding to PD-1 extracellular domain. In vitro ELISA assay is used to detect the binding property of the PD-1 antibody. Biotinylated PD-1 extracellular domain FC fusion protein (PD-1 FC) is coated onto 96-well plates by binding to neutralization avidin. Signal intensity after the addition of the antibody is used to determine the binding property of the antibody and PD-1.

[0088] Neutralization avidin (binding to biotin) was diluted to 1 µl/ml with PBS buffer, pipetted into a 96-well plate with at 100 µl/well and stood for 16h-20h at 4 °C. The 96-well plate was washed once with PBST (PH 7.4 PBS, containing 0.05% Tween20) after PBS buffer was removed, then the plate was incubated and blocked for 1 h at room temperature with addition of 120 µl/well PBST/1% milk. After removal of the blocking solution, the plate was washed with PBST buffer, followed by addition of 1 µg/ml biotin-labeled PD-1 FC which was diluted by PBST/1% milk, and incubated for 1 h at room temperature. After removal of the blocking solution, the plate was washed with PBST buffer for 3 times, followed by addition of the test PD-1 antibody which was diluted to a suitable concentration by PBST/1% milk, and incubated for 1.5 h at room temperature. After removal of reaction system, the plate was washed for 3 times with PBST buffer, followed by addition of 100 µl/well HRP-labeled anti-mouse secondary antibody (The Jackson Laboratory) which was diluted by PBST/1% milk, and incubated for 1 h at room temperature. After being washed with PBST for three times, the plate was added with 100 µl/well TMB, and incubated for 5-10 min at room temperature. Then the reaction was terminated with addition of 100 µl/well 1M H₂SO₄. The absorbance value at 450 nm was read on NOVOSTar microplate reader; the binding IC₅₀ value of PD-1 antibody was calculated.

[0094] The result showed that the antibody mAb6005 was very effective to block the binding of PD-L1 with PD-1.
EXAMPLE 3

Binding Selectivity Assay of PD-1 Antibody in Vitro

[0095] To detect the specific binding activity of PD-1 antibody to other proteins of the PD-1 family, human CTLA4 and human CD28 were used for binding assays. Meanwhile, the PD-1 of mice was also used for binding assays so as to determine the diversity of PD-1 antibody for different species other than human/mouse.

[0096] Selectively binding proteins: human PD-1, human ICOS, human CTLA4, human CD28 and mouse PD-1, (Beijing Sino Biological Inc.), were respectively diluted to 1 μg/ml with PBS buffer, pipetted into a 96-well plate at 100 μl/well and stood for 16 h-20 h at 4°C. The 96-well plate was washed once with PBST (PBS 0.05% Tween20) after PBS buffer was removed, then the plate was incubated and blocked for 1 h at room temperature with 120 μl/well PBST/1% milk. After removal of the blocking solution, the plate was washed with PBST buffer for 3 times, followed by addition of the test PD-1 antibody, and incubated for 1.5 h at room temperature. After removal of the reaction system, the plate was washed for 3 times with PBST, followed by addition of 100 μl/well H2O2-labeled anti-murine secondary antibody (The Jackson Laboratory) which was diluted with PBST/1% milk, and incubated for 1 h at room temperature. The plate was washed for 3 times with PBST, followed by addition of 100 μl/well TMB, and incubated for 5-10 min at room temperature. Then the reaction was terminated with addition of 100 μl/well 1 M H2SO4. The absorbance value at 450 nm was read on the NOVOSStar microplate reader.

[0097] The result demonstrated that mAB005 antibody exhibits no specific binding activity to other proteins of the PD-1 family. Meanwhile, mAb has no species cross-reactivity against murine PD-1.

EXAMPLE 4

In Vitro Cell Binding Assay of PD-1 Antibody

[0098] FACS (fluorescence-activated cell sorter) is a test method for detecting interaction of proteins and cells. The test is used for detecting the binding activity of PD-1 antibody to native PD-1 expressed on the cell surface. Cells used in the test are CHO cells highly expressing PD-1 (see Example 1, CHO cells transfected with PD-1 (SEQID NO: 2)).

[0099] The CHO cells highly expressing PD-1 were centrifuged at 1000 rpm for 5 minutes, and the pellet was collected and suspended with 10-15 ml of precooled flow buffer for cell count. Cells were centrifuged at 1000 rpm in 50 ml centrifuge tubes for 5 minutes and collected. After removal of the supernatant, the pellet was resuspended with precooled blocking buffer with density of 0.5-1.0x10^7 cells/ml. After incubation at 4°C for 30 minutes, re-suspension was pipetted to the 96-well plate at 100 μl/well. The 96-well plate was centrifuged at 1500 rpm for 5 minutes, the supernatant was discarded. 100 μl of primary antibody was added to each well; the cells were resuspended, and incubated in the dark for 60 minutes at 4°C. After centrifugation and discard of the supernatant, 100 μl of FITC-labeled secondary antibody (BD Biosciences) diluted at 1:400 was added. The cells were resuspended and incubated in the dark for 60 minutes at 4°C. Cells were washed twice with flow buffer, resuspended and fixed with 1% paraformaldehyde for flow cytometry assay.

[0100] The results show that mAB005 antibody can also bind to PD-1 on the cell surface.

EXAMPLE 5

In Vitro Binding Affinity and Kinetic Assay

[0101] Biosure method is a recognized assay which objectively detects the interactional affinity and kinetics of proteins. We analyzed the characterized affinity and binding kinetics of the test PD-1 antibody of the present invention by Biosure (GE).

[0102] According to the instruction of a kit provided by Biosure, the test PD-1 antibody of the present invention was covalently linked to CM5 (GE) chip using a standard amino coupling method. Then a series of gradient concentrations of PD-1 His protein (Beijing Sino Biological Inc.), which were diluted in the same buffer, were loaded into each cycle successively. After that, the samples were regenerated with regenerated reagent in the kit. The antigen-antibody binding kinetics was tracked for 3 minutes and the dissociation kinetics was tracked for 10 minutes. The data obtained was analyzed by GE’s BIACore evaluation software using 1:1 (Langmuir) binding model. Ka (kon), kd (koff) and KD values determined by the assay were shown in the following table.

[0103] The results showed that the binding kD value of the antibody mAB005 to PD-1 reached to 3.57 nM.

EXAMPLE 6

In Vitro Cytology Test

[0104] Fresh human peripheral blood mononuclear cells (PBMC) proliferation assay affected by antibody is used to detect the cell activity of the antibody mAB005.

[0105] Fresh human PBMC density was adjusted to 2x10^6/ml, seeded in a 6-well plate at 2 ml/well, and incubated for 6 hours at 37°C, 5%CO2. After the suspension cells were discarded, each well of adherent cells was mixed with 2 ml of RPMI1640 medium containing 10 ng/ml GM-CSF (granulocyte colony stimulating biological factor) and 100 ng/ml IL-4, and another 1 ml of RPMI1640 medium containing 10 ng/ml GM-CSF and 100 ng/ml IL-4 after...
incubation for 2 days, then the cells were continually cultured for 2 days, followed by addition of 100 ng/ml TNF-α (tumor necrosis factor-α) well each, and cultured for another 2 days to obtain mature dendritic cells. The dendritic cells and allogeneic T cells were respectively centrifugated and resuspended at a concentration of 1 x 10^6/ml and 1 x 10^7/ml, and pipetted into a 96-well plate at 100 μl/well, followed by addition of 20 μl/well of antibody which was diluted to different concentration gradients with PBS, and the cells were cultured in 37°C, 5% CO2 incubator for 5 days. Thereafter, 100 μl of cell culture was sampled to detect the cell proliferation with CellTiter-Glo® Luminescence Cell Viability Assay kit. The result was shown in FIG. 1, indicating that the test PD-1 antibody mAb005 can effectively stimulate the proliferation of human peripheral blood mononuclear cells, with EC50 of 83 ng/ml. The remaining sample was detected for secretion of cytokine IFN-γ. The result was shown in FIG. 2, demonstrating that the test PD-1 antibody mAb005 could stimulate PHM proliferation, and effectively stimulate secretion of cytokine IFN-γ at the same time, with EC50 of 13 ng/ml.

EXAMPLE 7

Murine Antibody Humanization

[0106] With reference to the sequences of the light chain variable region (mAb005 LCVR, SEQ ID NO: 10) and the heavy chain variable region (mAb005 HCVR, SEQ ID NO: 9) of the mAb005 antibody, humanized templates best matching with their non-CDR in Germline database were selected. The antibody heavy chain template is IgH3-7/JH6, selecting for FR1, FR2, FR3 of human germline light chain IGK1-39 and FR4 of JK4, with sequence of SEQ ID NO: 13; light chain template is IgK1-39/JK4, selecting for FR1, FR2, FR3 of human germline light chain IGK1-39, and FR4 of JK4, with sequence of SEQ ID NO: 14.

Human germin light chain template

[SEQ ID NO: 13]:

DQMTQPSLSLPLQGSRVFNTVIGCFCATCAOIQSGSSEVNLFFGQPQGAPELLIIA
AQLGQSGWVPFSRGSQGSGSTFDLITSISSLQEDFATTTCFCPGGTTXYEK.

[0107] The CDR of the murine antibody was grafted to the selected humanization template, replacing the CDR of human template, and then recombined with IgG4 constant region to obtain a humanized antibody H005-1. Afterwards, based on three-dimensional structure of the murine antibody, embedded residues, residues directly interacted with the CDR, and residues which significantly influence the conformation of VL and VH were backmutated to obtain humanized antibodies H005-2, H005-3, and H005-4, sequences are as follows.

[0108] Antibody Expression

H005-1 HC

SEQ ID NO: 11

EVQLVESGGGLVQPSGGLRLDCAASGPGPSVSNWYQAPGKAEKDNVAN
EKGQSSKELYDQYSWPHNYTISREHANSNLJYQLMISLAEDATYCYCAWQQ
GGTMYVS.

[0109] The HC sequence of the humanized antibody H005-1 with grafted murine CDR is (SEQ ID NO: 11), the LC sequence of the humanized antibody is (SEQ ID NO: 12). Sites which may affect the antibody activity were subjected to point mutations, the sequences are as follows:

<table>

</tr>
</tbody>
</table>

[0110] cDNAs were synthesized according to the amino acid sequences of the light chain and the heavy chain of each humanized antibody (SEQ NO 11, SEQ NO 12 and variants thereof). After the cDNAs were digested with XhoI and BamHI, the obtained cDNA fragments were inserted into pCDNA3.1 expression vectors (Life Technologies Cat. No.V700-20) at BamHI/XhoI restriction sites. The expression vectors and a transfection reagent PEI (Polysciences, Inc. Cat. No.23966) were used to transfect HEK293 cells (Life Technologies Cat. No. 11625019) at 1: 2, and the transfected cells were incubated in a CO2 incubator for 4-5 days. Expressed antibodies were recovered by centrifugation, and purified according to a conventional method to obtain the humanized antibodies of the present invention.

EXAMPLE 8

Humanized Antibody Activity Data

[0111] Humanized antibodies were subjected to ELISA binding assay (method is the same as that of Example 2), ligand binding blocking assay (method is the same as that of
Example 2), and affinity kinetics experiment (method is the same as that of Example 5) in vitro. The results are shown in the following table:

<table>
<thead>
<tr>
<th>Test Antibody</th>

</tbody>
</table>

[0112] The result showed that humanized antibodies H005-1, H005-2, H005-3 and H005-4 maintained the PD-1 binding activity, with affinity kinetics KD of 2.79, 2.98, 2.45 and 3.89 nM respectively. Simultaneously, all the humanized antibodies effectively exhibited blocking activity against the PD-1/PD-1 pathway.

EXAMPLE 9

Tumor Cell Growth Inhibition by PD-1 Antibody

[0113] 1. Experimental Materials:

[0114] U87MG cells (glioma cells): purchased from the Chinese Academy of Sciences Cell Bank, Cat. TCHu138;

[0115] PBMCs (peripheral blood mononuclear cells) purchased from the Shanghai Blood Center;

[0116] CD3: purchased from Miltenyi Biotec Cat No. 130-093-387;

[0117] CD28: purchased from Miltenyi Biotec Cat No. 130-093-375;

[0118] Cell Counting Kit-8: available from DOJINDO LABORATORIES, Cat. No. CK04;

[0119] mlgG (negative control): purchased from SANTA CRUZ Cat No. sc-2025; using dose of 1660 ng/ml.

[0120] 2. Experimental Methods:

[0121] 1) U87MG cells were cultured in EMEM medium containing 10% FBS and 1% P/S, incubated in a 96-well plate, 1x10^4 cells per well.

[0122] 2) H005-1 antibody was diluted to different concentration gradients (shown in abscissa of FIG. 3) with PBS, added to the 96-well plate at 10 ul/well, and incubated in 37° C., 5% CO2 incubator for 4 hours.

[0123] 3) After cell adherence, 80 ul of PBMC cell suspension was added to each well with a cell density of 2x10^4 cells/well, and 10 ul of CD3 antibody and CD28 antibody were added in each well, the final concentrations of CD3 and CD28 antibodies were both 500 ng/ml.

[0124] 4) After 72 hours of incubation in the 37° C., 5% CO2 incubator, 10 ul of CCK8 was added to each well for development. 2 hours later, OD450 was determined.

[0125] 3. Result:

[0126] The result was shown in FIG. 3, as compared with mlgG (negative control), different concentrations of PD-1 antibody (H005-1) had significant inhibitory effect on U87MG cell growth, and inhibition rate at the highest concentration was about 30%.

EXAMPLE 10

Activity of 11005-1 on Tuberculin-Stimulated PBMC Proliferation

[0127] The activity of the humanized antibody H005-1 on tuberculin-stimulated PBMC proliferation in vitro was detected.

[0128] To 15 ml of fresh PBMCs, about 3x10^7 cells, were added 20 μl tuberculin (Shanghai Byou Biotechnology, cat#97-8800) and the mixture were incubated for 5 days in the 37° C., 5% CO2 incubator. On day 6, the cultured cells were centrifugated, and resuspended into fresh medium with a density adjusted to 5x10^5 cells/ml. 190 μl of resuspended cells was planted into each well of a 96-well plate. The humanized antibody H005-1 was added to corresponding wells of the 96-well plate at 10 μl/well. The control group and blank group were added with 10 μl of PBS. The Cell culture plate was incubated in the 37° C., 5% CO2 incubator, and 72 hours later, PBMC Proliferation (Promega, cat #G7571) and IFN-γ secretion (Neo Bioscience, cat #E1H102 g) were determined. The results are as follows:

[0129] Activation Effect of the Test Sample on Tuberculin Stimulated PBMC Proliferation and IFN-γ Secretion

</tbody>
</table>

Note:

[0130] Experiment results showed that the humanized antibody H005-1 excellently activates exogenous tuberculin stimulated PBMC proliferation and IFN-γ secretion.

EXAMPLE 11

Inhibition of Subcutaneously Inoculated U-87MG Tumor by 11005-1

[0131] 100 ul of U87 cells (5x10^6 cells) was inoculated subcutaneously in right ribs of SCID-Beige mice. When the tumor grew to 80-100 mm^3 after 7 to 10 days, the SCID-Beige mice, getting rid of ones with too large or too small body weight or tumor, were randomly divided into a H005-1 10 mg/kg group and a Human IgG 10 mg/kg group according to the tumor volume, each group of seven mice (DO). Two kinds of PBMCs stimulated by CD3 antibody for 3 days were mixed at a ratio of 1: 1, and injected into the tumor tissues at 5x10^6 cells/60 ul, meanwhile, the test antibody was injected subcutaneously, once per 7 days for total 3 doses. Mice were measured for tumor volume and weighed twice a week. Data was recorded. Tumor volume (V) was calculated as: V=1/2axbxh, wherein a and b represented length and width, respectively.

[0132] The result was shown in FIG. 4: tumor volume change after treatment, and FIG. 5: mice weight change after treatment, indicating that antibody H005-1 excellently inhibited U87MG tumor growth, and had no effect on the body weight of the mice.

1. APD-1 antibody or an antigen-binding fragment thereof, comprising:
   a light chain variable region comprising at least one LCDR selected from those sequences as shown in: SEQ ID NO: 6, SEQ ID NO: 7 or SEQ ID NO: 8; and
   a heavy chain variable region comprising at least one HCDR selected from those sequences as shown in: SEQ ID NO: 3, SEQ ID NO: 4 or SEQ ID NO: 5.

2. The PD-1 antibody or the antigen-binding fragment thereof according to claim 1, wherein the light chain variable region comprises a LCDR1 as shown in SEQ ID NO: 6.

3. The PD-1 antibody or the antigen-binding fragment thereof according to claim 1, wherein the light chain variable region comprises a LCDR2 as shown in SEQ ID NO: 7.

4. The PD-1 antibody or the antigen-binding fragment thereof according to claim 1, wherein the light chain variable region comprises a LCDR3 as shown in SEQ ID NO: 8.

5. The PD-1 antibody or the antigen-binding fragment thereof according to claim 1, wherein the heavy chain variable region comprises a HCDR1 as shown in SEQ ID NO: 3.

6. The PD-1 antibody or the antigen-binding fragment thereof according to claim 1, wherein the heavy chain variable region comprises a HCDR2 as shown in SEQ ID NO: 4.

7. The PD-1 antibody or the antigen-binding fragment thereof according to claim 1, wherein the heavy chain variable region comprises a HCDR3 as shown in SEQ ID NO: 5.

8. The PD-1 antibody or the antigen-binding fragment thereof according to claim 1, wherein the light chain variable region comprises a LCDR1, a LCDR2 and a LCDR3 as shown in SEQ ID NO: 6, SEQ ID NO: 7 and SEQ ID NO: 8, respectively.

9. The PD-1 antibody or the antigen-binding fragment thereof according to claim 1, wherein the heavy chain variable region comprises a HCDR1, a HCDR2 and a HCDR3 as shown in SEQ ID NO: 3, SEQ ID NO: 4 and SEQ ID NO: 5, respectively.

10. The PD-1 antibody or the antigen-binding fragment thereof according to claim 1, wherein the light chain variable region comprises a LCDR1, a LCDR2 and a LCDR3 as shown in SEQ ID NO: 6, SEQ ID NO: 7 and SEQ ID NO: 8, respectively; and wherein the heavy chain variable region comprises a HCDR1, a HCDR2 and a HCDR3 as shown in SEQ ID NO: 3, SEQ ID NO: 4 and SEQ ID NO: 5, respectively.

11. The PD-1 antibody or the antigen-binding fragment thereof according to claim 1, wherein the antibody or the antigen-binding fragment thereof is a murine antibody or a fragment thereof.

12. The PD-1 antibody or the antigen-binding fragment thereof according to claim 1, wherein the antibody or the antigen-binding fragment thereof is a chimeric antibody or a fragment thereof.

13. The PD-1 antibody or the antigen-binding fragment thereof according to claim 12, wherein the light chain variable region sequence of the chimeric antibody is: SEQ ID NO: 10.

14. The PD-1 antibody or the antigen-binding fragment thereof according to claim 12, wherein the heavy chain variable region sequence of the chimeric antibody is: SEQ ID NO: 9.
15. The PD-1 antibody or the antigen-binding fragment thereof according to claim 1, wherein the antibody or the antigen-binding fragment is a humanized antibody or a fragment thereof.

16. The PD-1 antibody or the antigen-binding fragment thereof according to claim 15, wherein the light chain FR sequence of the light chain variable region of the humanized antibody is derived from a combination sequence of human germline light chains IGKV1-39 and JK4 as shown in SEQ ID NO: 14, comprising FR1, FR2 and FR3 of IGKV 1-39 and FR4 of JK4.

17. The PD-1 antibody or the antigen-binding fragment thereof according to claim 15, wherein the sequence of the humanized antibody light chain is a sequence as shown in SEQ ID NO: 12 or a variant thereof.

18. The PD-1 antibody or the antigen-binding fragment thereof according to claim 15, wherein the heavy chain variable region of the humanized antibody further comprises a heavy chain FR of human IgG1, IgG2, IgG3 or IgG4, or a variant thereof.

19. The PD-1 antibody or the antigen-binding fragment thereof according to claim 15, wherein the heavy chain FR sequence of the heavy chain variable region of the humanized antibody is derived from a combination sequence of human germline heavy chains IgHV3-7 and JH6 as shown in SEQ ID NO:13, comprising FR1, FR2 and FR3 of IgHV3-7 and FR4 of JH6.

20. The PD-1 antibody or the antigen-binding fragment thereof according to claim 15, wherein the sequence of the humanized antibody heavy chain is a sequence as shown in SEQ ID NO: 11 or a variant thereof.

21. A DNA molecule encoding the antibody or the antigen-binding fragment according to claim 1.

22. An expression vector comprising the DNA molecule according to claim 21.

23. A host cell transformed with the expression vector according to claim 22.

24. The host cell according to claim 23, wherein the host cell is bacteria.

25. The host cell according to claim 23, wherein the host cell is yeast.

26. A pharmaceutical composition comprising the PD-1 antibody or the antigen-binding fragment according to claim 1 and a pharmaceutically acceptable excipient, diluent or carrier.

27. A method for treating a PD-1 mediated disease or disorder in a human subject in need thereof, the method comprising administering to the subject a therapeutically effective amount of the antibody or the antigen-binding fragment according to claim 1.

28. The method of claim 27, wherein the PD-1 mediated disease or disorder is a cancer.

29. The method of claim 28, wherein the cancer is breast cancer, lung cancer, stomach cancer, intestinal cancer, renal cancer, melanoma or non-small cell lung cancer.
