

ANTIBODY SOCIETY

The **Antibody Society** is an international non-profit comprising individuals and organizations involved or interested in antibody-related research. We aim to facilitate discussion and interchange of ideas regarding issues of fundamental importance for basic research, therapeutic development and clinical testing in the field. To achieve our objectives, the Society has a variety of initiatives and working groups focused on improving the antibody field by:

- Creating opportunities for education and networking
- Monitoring and reporting advances in the commercial pipeline of antibody and CAR-T cell therapeutics
- Engaging government and international agencies on matters concerning the antibody community

The **Adaptive Immune Receptor Repertoire (AIRR) Community of The Antibody Society** is a research-driven group that is organizing and coordinating stakeholders in the use of next-generation sequencing (NGS) technologies to study antibody/B-cell and T-cell receptor repertoires. The AIRR Community and its associated meetings and workshops are developing standards and recommendations for:

- Obtaining, analyzing, curating and comparing/sharing NGS AIRR datasets
- Using and validating tools for analyzing AIRR data
- Relating AIRR NGS datasets to other “big data” sets, such as microarray, flow cytometric, and RNA gene-expression data
- Legal and ethical issues involving the use and sharing of AIRR data sets derived from human sources

Join our global community to receive:

- Access to valuable data on approved and investigational antibody therapeutics and other content in the **Members Only** section of the website
- Access to the Society’s career, research and educational resources
- Discounted registration for Antibody Engineering & Therapeutics
- Discounts of up to 20% on registration for other antibody-related meetings
- Opportunities to participate in the Society’s initiatives
- Opportunities to network with Society members
